- * If a voice is already sounding for a note number identical to the Source Note Number, this voice will continue sounding (i.e., legato) and will, when the next Note-on is received, smoothly change to the pitch of that Note-on.
- * The rate of the pitch change caused by Portamento Control is determined by the Portamento Time value.

BnH	65H	mmH
BnH	64H	llH

mm = upper byte (MSB) of parameter number specified by RPN

ll = lower byte (LSB) of parameter number specified by RPN

<<< RPN >>>

Control Changes include RPN (Registered Parameter Numbers), which are extended.

When using RPNs, first RPN (Controller numbers 100 and 101; they can be sent in any order) should be sent in order to select the parameter, then Data Entry (Controller numbers 6 and 38) should be sent to set the value. Once RPN messages are received, Data Entry messages that is received at the same MIDI channel after that are recognized as changing toward the value of the RPN messages. In order not to make any mistakes, transmitting RPN Null is recommended after setting parameters you need.

This device receives the following RPNs.

RPN	Data entry	Notes
<u>MSB, LSB</u>	<u>MSB, LSB</u>	
00H, 00H	mmH, llH	Pitch Bend Sensitivity mm: 00H - 18H (0 - 24 semitones) ll: ignored (processed as 00H) Up to 2 octave can be specified in semitone steps.

●Data Transmission

This instrument can use exclusive messages to exchange many varieties of internal settings with other devices.

The model ID of the exclusive messages used by this instrument is 00H 59H.

○Data Request 1 RQ1 (11H)

This message requests the other device to transmit data. The address and size indicate the type and amount of data that is requested.

When a Data Request message is received, if the device is in a state in which it is able to transmit data, and if the address and size are appropriate, the requested data is transmitted as a Data Set 1 (DT1) message. If the conditions are not met, nothing is transmitted.

5. Parameter Address Map

- * Transmission of "<#>" marked address is divided to some packets. For example, ABH in hexadecimal notation will be divided to 0AH and 0BH, and is sent/received in this order.
- * "<*>" marked address or parameters are ignored when the MC-909 received them.

Examples of MIDI messages

<Example1> 92 3E 5F

9n is the Note On status and 'n' is the MIDI channel number. Since 2H = 2, 3EH = 62, and 5FH = 95, this is a Note On message of MIDI CH = 3, note number 62 (note name D4) and velocity 95.

<Example2> C9 49

CnH is the Program Change status and 'n' is the MIDI channel number. Since 9H = 9, and 49H = 73, this is a Program Change message of MIDI CH = 10, Program number 74.

<Example3> E6 00 28

EnH is the Pitch Bend Change status and 'n' is the MIDI channel number. The 2nd byte (00H=0) is the LSB of the Pitch Bend value, and the 3rd byte (28H=40) is the MSB. However since the Pitch Bend is a signed number with 0 at 40 00H (= 64 x 128 + 0 = 8192), the Pitch Bend value in this case is

$$28\ 00H - 40\ 00H = 40 \times 128 + 0 - (64 \times 128 + 0) = 5120 - 8192 = -3072$$

If we assume that the Pitch Bend Sensitivity is set to two semitones, the pitch will change only -200 cents for a Pitch Bend value of -8192 (00 00H). Thus, this message is specifying a Pitch Bend of -200 x (-3072) ? (-8192) = -75 cents on MIDI CH = 7.

<Example4> B3 64 00 65 00 06 0C 26 00 64 7F 65 7F

BnH is the Control Change status, and 'n' is the MIDI channel number. In Control Change messages, the 2nd byte is the controller number, and the 3rd byte is the parameter value. MIDI allows what is known as "running status," when if messages of the the same status follow each other, it is permitted to omit the second and following status bytes. In the message above, running status is being used, meaning that the message has the following content.

B3 64 00	MIDI CH = 4, RPN parameter number LSB: 00H
(B3) 65 00	MIDI CH = 4, RPN parameter number MSB: 00H
(B3) 06 0C	MIDI CH = 4, parameter value MSB: 0CH
(B3) 26 00	MIDI CH = 4, parameter value LSB: 00H
(B3) 64 7F	MIDI CH = 4, RPN parameter number LSB: 7FH
(B3) 65 7F	MIDI CH = 4, RPN parameter number MSB: 7FH

Examples of system exclusive messages and calculating the checksum

Roland exclusive messages (RQ1, DT1) are transmitted with a checksum at the end of the data (before F7) to check that the data was received correctly. The value of the checksum is determined by the address and data (or size) of the exclusive message.

How to calculate the checksum

The checksum consists of a value whose lower 7 bits are 0 when the address, size and checksum itself are added.

The following formula shows how to calculate the checksum when the exclusive message to be transmitted has an address of aa bb cc ddH, and data or size of ee ffH.

$$\begin{aligned}aa + bb + cc + dd + ee + ff &= \text{total} \\ \text{total} \div 128 &= \text{quotient} \dots \text{remainder} \\ 128 - \text{remainder} &= \text{checksum}\end{aligned}$$

<Example1> Setting the REVERB to SRV Room (DT1)

Referring to "Parameter Address Map," the starting address for Part Info is 10 00 00 00H, and offset address of Part Info Common Reverb is 00 06 00H, and the Reverb Type address is 00 00H. Therefore, the address will be

$$\begin{array}{r}10\ 00\ 00\ 00H \\00\ 06\ 00H \\+) \quad 00\ 00H \\ \hline10\ 00\ 06\ 00H\end{array}$$

Since SRV Room is parameter value 02H,

F0	41	10	00	59	12	10 00 06 00	02	??	F7
(1)	(2)	(3)	(4)	(5)	(6)	address	data	checksum	(7)

(1) Exclusive status	(2) ID number (Roland)	(3) Device ID (17)
(4), (5) Model ID (MC-909)	(6) Command ID (DT1)	(7) EOX

Next we calculate the checksum.

$$\begin{aligned}10H + 00H + 06H + 00H + 02H &= 16 + 0 + 6 + 0 + 2 = 24 (\text{sum}) \\ 24 (\text{total}) \div 128 &= 0 (\text{quotient}) \dots 24 (\text{remainder}) \\ \text{checksum} &= 128 - 24 (\text{remainder}) = 104 = 68H\end{aligned}$$

This means that the message transmitted will be F0 41 10 00 59 12 10 00 06 00 02 68 F7.

<Example2> Obtaining part information data (RQ1)

Referring to "Parameter Address Map," the starting addresses for Part Information are assigned as follows.

10 00 00 00H	Part Info Common
10 00 02 00H	Part Info MFX1
10 00 04 00H	Part Info MFX2
10 00 06 00H	Part Info Reverb
10 00 08 00H	Part Info Comp/EQ
10 00 0A 00H	Part Info External Input
10 00 20 00H	Part Info Part 1
10 00 21 00H	Part Info Part 2
:	
10 00 2F 00H	Part Info Part 16

Since the size of Part Info Part is 00 00 00 0CH, this size is added to the starting address of Part Info Part 16, to obtain

$$\begin{array}{r}10\ 00\ 2F\ 00H \\+) \quad 00\ 00\ 00\ 0CH \\ \hline10\ 00\ 2F\ 0CH\end{array}$$

Therefore, the size of the data to be obtained is

$$\begin{array}{r}10\ 00\ 2F\ 0CH \\-) \quad 10\ 00\ 00\ 00H \\ \hline00\ 00\ 2F\ 0CH\end{array}$$

F0	41	10	00	59	11	10 00 00 00	00 00 2F 0C	??	F7
(1)	(2)	(3)	(4)	(5)	(6)	address	data	checksum	(7)

(1) Exclusive status	(2) ID number (Roland)	(3) Device ID (17)
(4), (5) Model ID (MC-909)	(6) Command ID (RQ1)	(7) EOX

When the checksum is calculated in the same way as in <Example 1>, we have the following message to be transmitted: F0 41 10 00 59 11 10 00 00 00 00 00 2F 0C 35 F7.
